AB A method and app. for the physico-chem. encoding of a collection of beaded resin ("beads") to det. the chem. identity of bead-anchored compds. by in-situ interrogation of individual beads. The present invention provides method and app. to implement color-coding strategies in applications and including the ultrahigh-throughput screening of bead-based combinatorial compds. libraries as well as multiplexed diagnostic and environmental testing and other biochem. assays. A method is described for identifying a compd. having a selected property of interest in a library of compds., each of said compds. being bound to its resp. solid support, and being produced by a unique reaction series composed of 1 to about 100 steps, wherein each compd. is prepd. from a component. The component may be an amino acid, a hydroxy acid, an oligoamino acid, an oligopeptide, a saccharide, an oligosaccharide, or a protein. Examples of the protein component include enkephalin, vasopressin, oxytocin, atrial natriuretic factor, bombesin, calcitonin, parathyroid hormone, neuropeptide Y and endorphin. An example of the solid support include color-encoded PEG-polystyrene microspheres.
